Algorithmic Trading Hackathon

Build and deploy a fully functional algorithmic trading system on Delta Exchange Testnet using Python and FastAPI.

Event Objective

Design Strategy

Develop trading logic and decision frameworks

Automated Execution

Implement API-based trade execution

Risk Management

Programmatically manage positions and exposure

Live Demo

Deploy working system on testnet

This is a hybrid strategy + implementation hackathon promoting algorithmic thinking in financial markets.

Made with GAMMA

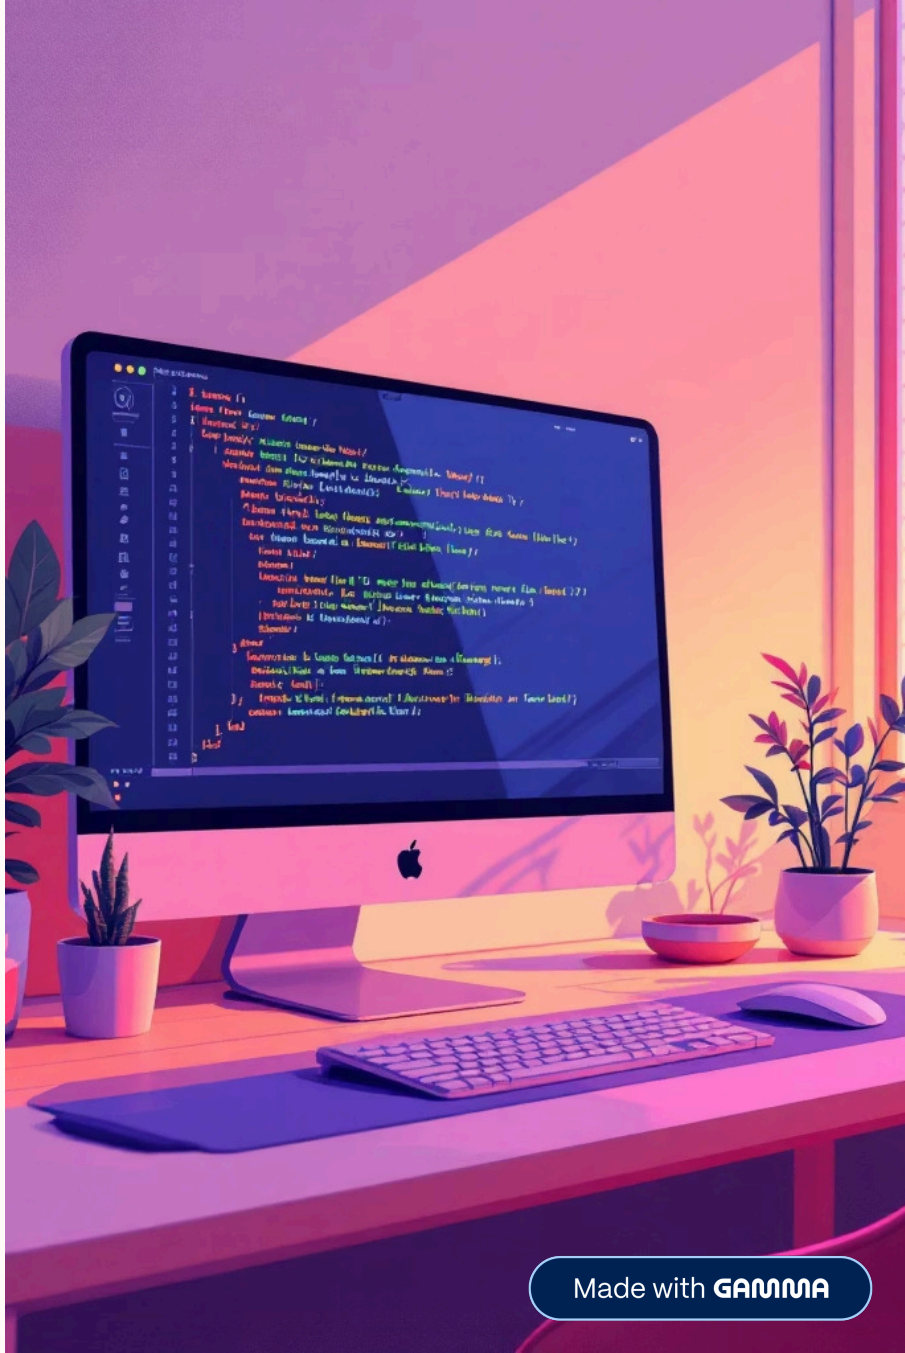

Core Problem Statement

Success Criteria

- Connect to Delta Exchange Testnet via API
- Execute trades automatically based on defined logic
- Manage positions and risk programmatically
- Demonstrate live execution during demo
- Document strategy logic clearly

Strategy Freedom

Participants may build their own original strategy or choose from suggested strategies provided by organisers.

Made with GAMMA

Trading Environment

Delta Exchange Testnet

Testnet only, no real capital involved. Paper trading allowed with testnet mimicking live market behaviour.

No Historical Data

All trading must occur via testnet APIs. No historical datasets will be provided.

Made with GAMMA

Technology Stack

Python (FastAPI)

Backend framework for API integration and strategy implementation

Delta Exchange API

Mandatory integration for testnet connectivity and trade execution

Websocket Integration

Optional for live market updates and real-time data streaming

Frontend (Optional)

React, Next.js, or any frontend framework for UI development

Why Delta? We've worked with Delta before, enabling us to resolve participant doubts effectively. Delta is easier to set up and work with compared to others like CoinSwitch.

GitHub Template Repository

Repository Structure

- `main.py` - FastAPI starter
- `strategy.py` - Strategy logic placeholder
- `delta_client.py` - API wrapper example
- `requirements.txt`
- `README.md` with documentation

Documentation Requirements

- Setup instructions
- Environment variable configuration
- API key instructions
- Strategy explanation section

Made with GAMMA

Team Rules & Requirements

01

Team Size

Minimum 2, maximum 5 members per team

02

Submission Deadline

5:00 PM sharp on event day

03

Code Originality

Project must not be completely AI-generated (20-30% AI-generated code acceptable)

04

Technical Knowledge

Teams must be able to explain their code and logic during evaluation

Made with GAMMA

Submission Format

Public GitHub Repository

Working codebase accessible for evaluation

README Documentation

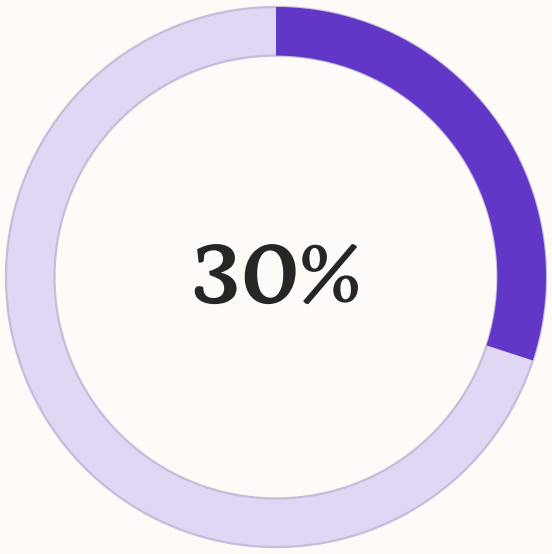

- Strategy explanation
- Risk management explanation
- Setup instructions
- API usage description

Live Demo

Show API connectivity, trigger automated execution, display positions, explain logic

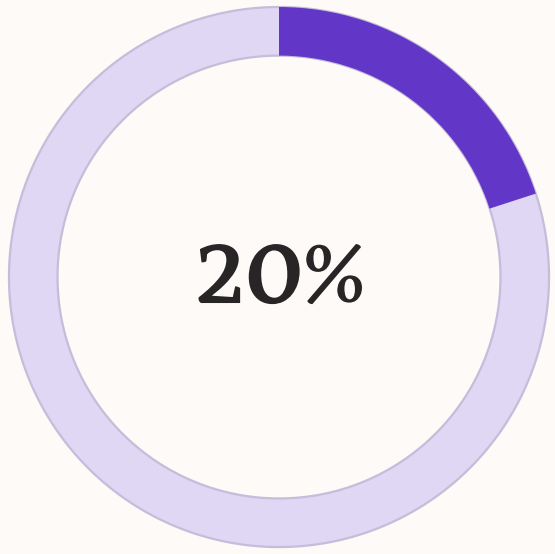

Made with GAMMA

Judging Criteria

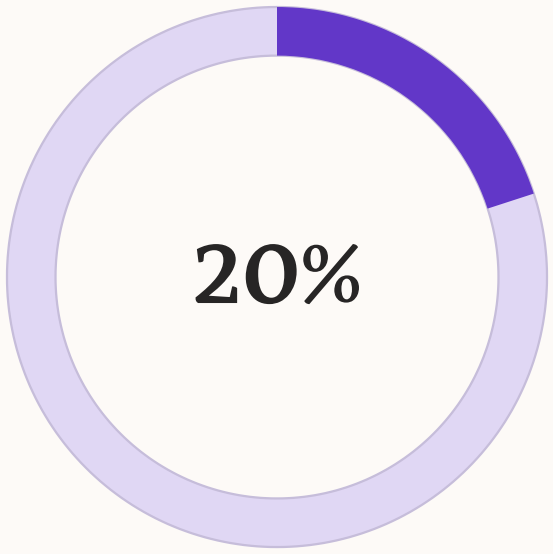

Strategy Logic & Clarity

Well-defined trading strategy with clear rationale

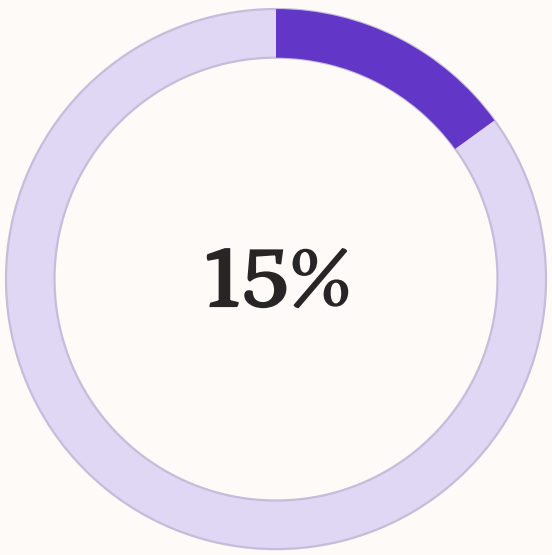

Risk Management

Effective position and exposure management

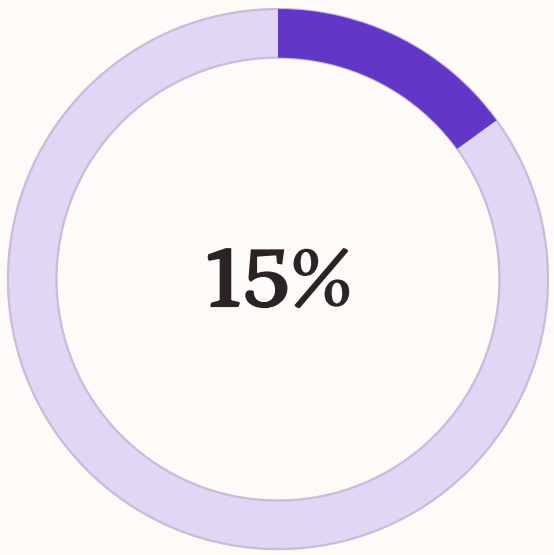

Technical Implementation

Clean, well-structured code architecture

API Execution & Automation

Working automated trade execution

Demo & Explanation

Clear presentation and technical answers

Note: Live short-term PnL will not be the primary evaluation criteria.

Ready to Start?

Fork Template

Clone the provided GitHub repository

Build Strategy

Implement your trading logic and API integration

Deploy & Demo

Launch on testnet and prepare presentation

Good luck building your algorithmic trading system!
